

## Biology

Inhalation	Exhalation
Diaphragm contracts, moves downwards.	Diaphragm relaxes, moves upwards.
Intercostal muscles contract, ribs move up and out.	Intercostal muscles relax, ribs move down and in.
Air drawn in to the lungs.	Air forced out of the lungs.

### Adaptations of alveoli for gas exchange

Thin walls; large surface area; moist surface and many blood capillaries.

### Effects of smoking:

Smoker's cough (damaged cilia); nicotine addiction; lung cancer; emphysema (damaged alveoli) and coronary heart disease.

### Effects of exercise on the body:

Increased heart rate; increased breathing rate and increased temperature.

Gas Exchange	The process which occurs at the alveoli to move oxygen into our blood and carbon dioxide out of our blood. In plants, this takes place at the stomata.
--------------	--

<b>Respiration</b>	A chemical reaction that takes place in the mitochondria. Releases energy for life processes.
<b>Aerobic Respiration</b>	In <b>all</b> organisms; oxygen + glucose → water + carbon dioxide
<b>Anaerobic Respiration</b>	In <b>plants and animals</b> ; glucose → lactic acid  In <b>unicellular organisms</b> this is known as <b>fermentation</b> .  Anaerobic respiration releases <b>less energy</b> than aerobic respiration.

## Chemistry

<b>Combustion</b>	When a fuel reacts with oxygen to produce carbon dioxide and water. Fuel + oxygen → carbon dioxide + water
<b>Thermal Decomposition</b>	When a substance is broken down to form new products using heat. Carbonate → Oxide + carbon dioxide
<b>Neutralisation</b>	When an acid and alkali react to form a salt and water. Acid + alkali → salt + water
<b>Exothermic</b>	A reaction which releases energy in the form of heat to the surroundings.
<b>Endothermic</b>	A reaction which absorbs energy in the form of heat from the surroundings.
<b>Catalyst</b>	A substance which increases the rate of a chemical reaction without being used up.

## Physics

<b>Energy</b>	A quantity required to do work. e.g. movement or heating.
<b>Renewable</b>	An energy source that <u>will not</u> run out on a time scale of 1 million years. e.g. solar and wind.
<b>Non-renewable</b>	An energy source that <u>will</u> run out on a time scale of 1 million years. e.g. coal, oil or gas.
<b>Power</b>	The rate of energy transfer, measured in watts (W).  Power (W) = Energy (J) / time (s)

### Converting units:

$$1000 \text{ W} = 1 \text{ kW}$$

$$1000 \text{ J} = 1 \text{ kJ}$$

$$3,600,000 \text{ J} = 1 \text{ kWh}$$

$$3600 \text{ s} = 1 \text{ h}$$

**Hazard:** something that could cause harm to you or another person e.g. broken glass.

**Risk:** how the hazard causes harm e.g. cuts.
